

MacroSnaps — Architecture Overview

Generated 15 March 2026 · ralphlazar.github.io/macrosnaps

File / Script	Type	Role	Run when
data.json	Data	Single source of truth for all content — metrics, stories, sparklines, commodities.	Read/written by pipeline scripts; never edited manually
macrosnaps-shell.html	Source	UI template — all JS, CSS, layout. build.py injects data.json to produce globe.html.	Edited in UI sessions; never deployed directly
build.py	Source	Assembles globe.html from shell + data, validates, diffs, auto-commits and pushes.	Daily (end of ritual) or after any change
macrosnaps-globe.html	Output	Built output served on GitHub Pages. Never edited manually.	Generated by build.py — do not upload to sessions
fetch_market_data.py	Pipeline	Fetches equity, FX, yields via yfinance + FRED; appends today's commodity prices to sheet.	Daily — step 1 of ritual
sync_commodity_data.py	Pipeline	Reads Commodities tab; derives price, day-over-day change, 120-pt spark; writes to data.json.	Daily — step 2 of ritual (--apply)
update_commodity_stories.py	Pipeline	Rewrites commodity stories when price moves exceed threshold.	Daily — step 3 of ritual
update_headlines.py	Pipeline	Claude API (Haiku batch + Sonnet+search) — writes country and global stories to draft JSON.	Daily
sync_sheet.py	On change	Reads Macro-stats Google Sheet; writes annual forecast arrays and card values to data.json.	When forecast sheet changes (--apply)
sync_monthly_actuals.py	On change	Reads MACRO-MONTHLY sheet; writes monthly_actuals to data.json. Never touches forecast fields.	Monthly, when actuals land
update_stories.py	On change	Diff-driven per-metric story rewrites across 12 countries × 6 metrics × 3 levels.	After metric values change
populate_monthly_actuals.py	On change	Backfills monthly actuals from FRED/ILO into MACRO-MONTHLY sheet. Pending: JPN inflation fix.	One-off / re-run on data gap fixes
market-stats-key.json	Data	Google Sheets service account key — required by all gspread calls.	Credential — confirm it's in .gitignore
LIVING_BRIEF.md	Data	Persistent project context — uploaded at the start of every session.	Read-only in sessions; updated at session end
